Every component in the bin, drawn as an engineer would draw it, and read as a mind would use it.

A resistor limits flow. A diode admits it one way. A capacitor retains what arrives. Each of those is also a statement about a mind — and the correspondence is tighter than a metaphor, which is exactly why it needs a badge saying how far it carries.

This is the part bin for *CAS PCBA Engineer*, drawn. Forty-two entries, one page each: the symbol, its job in a circuit, the cognitive role it plays, a worked example in CAS notation, and the guardrail that marks where the analogy stops. Every mapping carries exactly one badge — **ISO**, **ENG** or **PED** — and never a hybrid.

Ten cognitive schematics follow, from the single-transistor atom up to the power-management board, showing what every wire carries. Then the whole library compresses to one memorisable table. Fifty-six cut-out cards are published alongside this guide.

Little Henderson is the creator of the Cognitive Architecture System and the Noetic Compass assessment framework, and the author of the Noetic Compass Press series.
