We would never accept from a bridge, a pacemaker, or a power supply what we routinely accept from an AI system.

This is the circuit-design discipline for cognition. It begins with a single discovery: the transistor has an exact structural twin in thought. A bias controls the path from a cause to an effect the same way a base current controls collector-to-emitter flow.

From that Cognitive Junction Transistor the book builds a complete component library — resistors, capacitors, inductors, diodes, amplifiers, filters, oscillators, power management — and then five full Cognitive Circuit Boards, including a Cognitive Safety Board you design, test, and sign off.

A bench book. Every component has a datasheet. Every board has a schematic, a bill of materials, test points, and a failure-mode table. All 105 exercises are answered in full. No electronics background assumed; none in CAS either. Both are taught from first principles, exactly where you need them.

Little Henderson is the creator of the Cognitive Architecture System and the Noetic Compass assessment framework, and the author of the Noetic Compass Press series.
